Global Liquidity Watch: Weekly Update

Global Liquidity and Risk Appetite Turn Lower

MICHAEL HOWELL
MAR 31, 2026 · PAID

Global liquidity has declined for four consecutive weeks to US$187.9tr, pressured by a strengthening US dollar, weaker collateral values and a sharp spike in bond market volatility. While the PBoC continues to provide support, other major Central Banks are restricting liquidity growth. Consequently, investor risk appetite is cooling across both emerging and developed markets, with global exposure indices retreating from their early 2026 peaks.

Global Liquidity Update

Global Liquidity has declined for four weeks in a row. Latest ***flash*** estimates put it at **US$187.9tr.** Short-term momentum, measured by the 3m annualized growth rate, is edging higher due to a base effect (5.8%). The annual rate of growth though is slipping (6.4%). As liquidity levels dips, the base effect which underpinned annual growth rates in early 2026 diminishes.
